

Instructions:

The task is to detect whether a target dot was presented on the screen. There will be a cross presented at the center of the screen and two sets of vertical lines on the left and right sides of the cross. The dot may appear in between the two vertical lines either on the right or the left side. There will, additionally, be an arrow presented centrally at the beginning of a run. Throughout the experiment, you must keep your eyes fixed on the cross, while attending to the location indicated by the arrow, without explicitly moving your eyes there. To indicate that there is a target dot present, please press the 'Space bar' on the keyboard. Please report if you see the dot at either location, irrespective of the location the arrow is pointing to. It is also important that you do not press the key if you do not see the dot. Each run will have a few trials and there will be 200 runs in total, the run number will be displayed before it starts. You can take breaks at your will but please do so only when a run gets completed. The whole experiment might take around 1 hour and 30 minutes.
